

Getting Dispute onto TestFlight

Written for this app specifically, with the parts that are already done marked as such. The short version: everything up to the archive works today, and the only blocked step is the upload, which needs a paid membership.

Why the Apple ID matters

The Apple ID that *enrols* is the legal party to the contract with Apple, and its team owns the bundle identifier and the signing certificates. That last part is not a formality — `com.noahpuckett.Dispute` belongs to team `4V5Z7PZXKN` ("James Puckett"), and no other team can ever use that string. Enrolling a different Apple ID means a different bundle identifier, which means a new container on every phone and the 1.1 GB model downloading again.

The Apple ID you *work with day to day* is a separate question and barely matters. Team members get their own seats.

Apple requires the legal age of majority to enrol, so this account is in James Puckett's name. That happens to be the same team that already owns the bundle identifier, so nothing has to move.

Phase 1 — Enrol (Account Holder only)

Has to be done by him, as himself: his identity, his card, his contract.

- 1 Two-factor authentication on `jamesandxingyi@gmail.com`.
- 2 <https://developer.apple.com/programs/enroll> → **Individual / Sole Proprietor**.
- 3 Legal name and address. Apple may ask for photo ID.
- 4 \$99/year, auto-renewing. Verification is usually 24–48 hours.

On an Individual enrolment the **App Store seller name is his legal name and is public**. The only alternative is an Organization enrolment, which needs a registered legal entity and a D-U-N-S number.

Phase 2 — Add the second seat

App Store Connect → **Users and Access** → invite `noahpuckett99@gmail.com` as **App Manager**. That covers builds, TestFlight, testers and metadata.

Reserved to the Account Holder: legal agreements, renewals, banking.

Worth knowing that **a pending license agreement freezes uploads and releases until he accepts it**, which is the one thing that will need him at short notice.

Phase 3 — Project configuration — DONE

- `INFOPLIST_KEY_ITSApplUsesNonExemptEncryption = NO`. The app only makes ordinary HTTPS requests, which are exempt; declaring it here is what stops App Store Connect asking the same export-compliance question on every upload.
- `MARKETING_VERSION = 1.0`, `CURRENT_PROJECT_VERSION = 1`. **Every upload needs a build number never used before for that version** — bump `CURRENT_PROJECT_VERSION` each time, and leave the marketing version alone until the app itself changes meaningfully.
- The 1024pt marketing icon is present, which is a common submission blocker.
- Release configuration archives clean, verified. All debug scaffolding (`DebugSeed`, `-forceDownloadableAI`, `-startDownload`) is behind `#if DEBUG` and does not ship.

Phase 4 — Create the app record

App Store Connect → **My Apps** → **+** → **New App**:

- Platform iOS, bundle ID `com.noahpuckett.Dispute` (it will be in the list).
- **The app name has to be unique across the entire App Store**, so "Dispute" may not be available. This is a listing decision only — the name on the home screen comes from the bundle and does not have to match.
- SKU is private; anything stable, e.g. `dispute-001`.

Phase 5 — Archive and upload

Xcode → destination **Any iOS Device (arm64)** → **Product** → **Archive** → **Distribute App** → **TestFlight & App Store**.

Until Phase 1 completes this step fails with exactly:

```
No signing certificate "iOS Distribution" found
Team "James Puckett" does not have permission to create
"iOS App Store" provisioning profiles
```

That is the membership and nothing else. Everything before it already works.

Phase 6 — Testers

Internal, up to 100. Anyone holding an App Store Connect role on the team. No review, live within minutes. This is where both of you should be.

External, up to 10,000. Email invite or public link. The first build of each version goes through Beta App Review, normally about 24 hours; later builds of the same version usually clear in minutes.

Phase 7 — Upkeep

- **TestFlight builds expire after 90 days.** Testers lose the app completely, including the downloaded model — they pay the gigabyte again on reinstall.
- Membership renews annually. A lapsed membership pulls the app from sale and stops TestFlight.

Paste-ready

What to Test

Two people, one phone. Type what you're arguing about, then take turns saying your side. The app builds one list of points from both of you, unlabelled, and you each tick what you agree with. At the end it names the crux — the question underneath the argument.

On an iPhone 15 Pro or newer the AI is built in and free. On anything older the app offers a one-off 1.1 GB download over Wi-Fi, or works entirely by hand if you skip it. Both paths are worth testing.

Nothing you write leaves the phone. There is no account and no upload.

App Review notes

This app can optionally download a language model (Qwen3 1.7B, Apache 2.0, ~1.1 GB) so that phones without Apple Intelligence get the same features. The download is:

- optional — the app is fully usable without it, and manual mode is the default; - Wi-Fi only, enforced in code, and never started without an explicit tap; - model weights only. No executable code is downloaded (guideline 2.5.2); - verified against a published SHA-256 checksum before use; - removable from Settings, which deletes the file and frees the space.

All inference runs on-device. The app makes no network requests at all other than this one download. Nothing the user writes is ever transmitted.

App Privacy

Data Not Collected, every category. The app has no account, no analytics, no third-party SDKs, and stores one JSON file in Application Support that **Settings → Delete this argument** removes.
